

Eastboard Consoles designed, built & installed the technical furniture for WPVI's new facility expansion. We designed an exclusive component console system with modular elements. Consoles can be disassembled, rearranged, or the components replaced to suit new operator or equipment requirements, which gives WPVI the ability to adapt their control rooms to future needs. This expansive project includes two double-tier production control rooms, a three-console master control room, a 20-bay wraparound transmission and microwave console, and 21 edit suites. Integration work is being done by The Systems Group along WPVI and Disney engineering, and the new digital facility is scheduled for completion in the late summer of 2009.
